

Using UAS and remote sensing in Danish national trials

The 4th Annual – Nordic Plant Phenotyping Network Workshop,
November 22nd – 23rd, 2018

Lars Bonde Eriksen, Senior Specialist

SEGES

Biomass measurements from drone and satellite

- Farmers union trials
- Biomass measurements in trials
- Measurement from satellite and use in farming

Field trials organised by SEGES

- 1000 trials per year
 - Variety trials = 400
 - Fertilizer trials = 240
 - Plant Protection = 260
 - Miscellaneous = 100
- Results published in December
- Distributed between 13 local trial units

SEGES

Raw data is published online in the season

SEGES

Application in trials

- Documentation of the trial
- Compare growth of different varieties:
 - Autumn growth
 - Speed of early spring growth
 - Earliness
- Nitrogen uptake
- Yield estimates

Winter wheat varieties

1. december 2017

SEGES

Winter wheat variety trial 1. december 2017

Vegetation index NDVI or NDRE, winter wheat

Parameter estimates from growth curves

Sowing date	Variety	Autumn growth	Max slope	Days to max slope
5. Sept.	Kalmar	0,34 a	-15,5 ab	211 abcd
	Torp	0,27 cde	-15,9 ab	211 abcd

NDVI on CropManager.dk

Precision farming, variable seed rates

Summary on the use of drone and satellite images

- Drone images:

- Document the quality of field trials
- Cultivar evaluation, growth habits
- Estimate of nitrogen uptake

- Satellite images:

- Crop analysis on field and country scale
- Precision agriculture, variable application of:
 - Nitrogen, Growth regulators, Fungicides, Seed
